# Ryan Porter

**Chief Technology Officer | Applied AI and Data Systems Executive**

Miami Beach, FL | linkedin.com/in/ryanalynporter | github.com/AnthusAI | anth.us/ryan

## Executive Profile

Applied AI and data systems leader who put a fully automated, self-improving agent system into commercial production, hands-on through architecture and code. Builds the parts that make enterprise AI trustworthy at scale: ground-truth evaluation, statistically gated promotion, fine-tuned production models, and a human-feedback data flywheel driving automated root-cause analysis. Brings more than 30 years of experience spanning data warehouses, data lakes, information architecture, cloud and serverless systems, security, compliance, and mission-critical software.

## Leadership Focus

Self-Evolving AI Systems | Hill-Climbing Optimization | Fine-Tuning and Training Data Pipelines | Data Flywheels | Agent DSLs and Runtimes | Automated QA | Root-Cause Analysis | MLOps and LLMOps | Cloud and Serverless Architecture | Hands-On Technical Leadership

## Professional Experience

**DataParade | Chief Technology Officer**
**Sep 2026 - Present | Miami Beach, FL (Remote)**

- Leads technology on a three-person team at an early-stage privacy and security startup building tools that help developers keep up with AI-generated code, exposing the risks hidden in code no one reads anymore.
- Directs development of a deterministic scan engine that maps how sensitive data moves through a codebase (ingest, language analyzers, pattern-based classification, and data-flow detection) and renders it as a reviewable graph, across eight languages plus Terraform.
- Shipped the scanner as an open-source, one-command CLI (github.com/DataParade-io/dataparade-cli) feeding the DataParade web app.
- Brought Capacity's ground-truth evaluation discipline to security tooling: Plexus scores scanner accuracy on data mentions, items, components, and flows against labeled fixtures.

**Capacity / Call Criteria | Chief Scientist**
**Capacity, Automated QA / Call Criteria Division | Apr 2025 - Aug 2026**
**Call Criteria, Chief Scientist - Anthus Client Engagement | Jan 2024 - Apr 2025**
**Miami Beach, FL (Remote)**

- **Built Call Criteria's AI/ML lab from scratch** and ran it for nearly three years, from R&D on text classifiers and LLM orchestration through production call-center QA, on a system that grew to close to ten people working on it.
- Carried the lab through Capacity's April 2025 acquisition, joining full time to help build Automated QA.
- Delivered a **fully automated hill-climbing optimization loop** that improves production QA classifiers without human prompt engineering. Agents are versioned code, so coding agents perform root-cause analysis on reviewer disagreements, propose competing hypotheses, edit the agent source, evaluate each variant against ground-truth labels, and synthesize the winners into the next generation, iterating until alignment converges or the cost budget is spent.
- Engineered the controls that make unattended self-modification safe for customer-facing work: a change ships only if it improves agreement with human reviewers (Gwet's AC1) against both a frozen benchmark and recent review, by a margin too large to be chance and on enough labeled examples to trust, and never if it lifts the overall score by getting worse at the cases that matter most. Runs are capped on spend.
- Operated the platform at commercial scale: by August 2026 it had produced over **15 million scoring decisions** across 2 million customer conversations, running production LLM workloads of more than 180 billion tokens.
- Ran fine-tuned classification models **in production for years** on a SageMaker training-to-serving pipeline that

versions model artifacts and serves either custom ML models or fine-tuned LLMs behind Realtime and Serverless Inference endpoints, with human ground-truth labels as supervised training data and tuning records held out of evaluation.
- Built the loop's diagnostic layer: corpus-scale root-cause analysis over disagreement patterns, escalation to structural rewrites when improvement plateaus, and detection of contradictory reviewer labels, routed to calibration rather than burning cycles on an unwinnable prompt.
- Built the production platform **fully serverless on AWS**: scoring on Lambda, service work in ECS containers, SQS and EventBridge for asynchronous queueing and scheduling, and a web console on Amplify, with request correlation, failure recovery, and concurrency control across AI services, the whole stack defined as infrastructure as code in AWS CDK.
- Made the same platform **portable off AWS** rather than locked to a single cloud, running self-hosted on Helm-packaged Kubernetes with PostgreSQL and S3-compatible object storage, with prediction, evaluation, optimization, and champion promotion all verified there by an executable acceptance suite.

## Open-Source Platforms

Actively developed open-source repositories on GitHub with multiple stakeholders and public commit history. The engineering described here is open to direct inspection at the URLs below. Plexus, Tactus, and Biblicus were **put into production at Capacity / Call Criteria**, and Plexus now also evaluates the DataParade scanner.

- **Plexus** - github.com/AnthusAI/Plexus - AI agent and MLOps platform: classifier execution, evaluation, versioning, champion/challenger experimentation, and the human-feedback data flywheel.
- **Tactus** - github.com/AnthusAI/Tactus - domain-specific language and runtime expressing agent procedures as versioned, executable code rather than ad hoc prompts.
- **Biblicus** - github.com/AnthusAI/Biblicus - pluggable architecture for whole-corpus analysis using topic modeling, Hidden Markov models, retrieval, and LLM-based techniques.
- **Kanbus** - github.com/AnthusAI/Kanbus - project management and durable memory for AI agents.
- **Auritus** - github.com/AnthusAI/Auritus - open-source ElevenLabs Audio Native alternative that narrates web pages with open TTS models on local GPUs, with AWS GPU fallback, to cut cost.
- **VideoML** - github.com/AnthusAI/VideoML - declarative domain-specific language for video generation.

**Anthus AI Solutions | Lead AI Solutions Architect**
**Dec 2023 - Present | Miami Beach, FL (Remote)**

- Independent AI practice that delivered the Call Criteria engagement from January 2024 until the 2025 acquisition.
- Maintains the open-source portfolio above, used at Capacity, DataParade, and other clients.

## Technology Executive Leadership

**Tao Group Hospitality / Hakkasan Group | Miami Beach, FL (Remote)**
**Vice President, Marketing Technology | Apr 2021 - Jan 2024**
**Vice President, Technology | Feb 2014 - Apr 2021**

- Bootstrapped an agile hospitality platform that became mission-critical to the larger enterprise, then shepherded it through successive acquisitions and two major architectural shifts: cloud computing and serverless computing.
- Led **three agile teams totaling approximately 12 employees** and remote contractors, with responsibility for hiring, performance management, budgeting, roadmap execution, and executive reporting.
- Designed and operated a platform spanning ticketing, reservations, guest lists, artist booking, payments, and venue operations. Systems processed as much as **$64 million in monthly revenue** with **no major incidents**.
- Built a cloud enterprise data warehouse and integrations supporting analytics, Salesforce, Marketo, and Salesforce Marketing Cloud.
- Evolved the platform from on-premises and monolithic applications to scalable AWS cloud and serverless architectures, preserving operational continuity through the Hakkasan, Tao Group, and Madison Square Garden Entertainment acquisitions.
- Replaced a legacy checkout and payment flow with serverless, tokenized components that **eliminated internal storage and processing of cardholder data** and reduced PCI responsibility.

- **Cleared an independent outside audit** commissioned to determine whether the platform was mature, compliant, and low-risk enough to remain in operation, validating both its architecture and the controls governing it.
- Brought the platform into compliance with Nevada Gaming Control Board regulations, then **won regulatory approval to run it on AWS** rather than on hardware physically located inside Nevada.
- Delivered a serverless Athena and QuickSight data lake covering every sale record from the ticketing platform, preserving accounting and regulatory reporting as operational responsibility for the workload transferred to a third party.
- Personally built the event ticket-sales and barcode-redemption platform, which had generated more than **$150 million in ticketing revenue by April 2021**, as well as reservation systems processing millions of dollars monthly.
- Modernized customer-facing and operational systems using Angular, React/Next.js, real-time synchronization, GraphQL, and AWS Amplify, eliminating prior scaling failures during high-profile traffic spikes.
- Introduced DevOps, Kanban, Jira workflows, and Docker-based continuous delivery across internal teams and external agencies. Also built an OpenAI function-calling agent for live operational metrics.

## Earlier Experience

**President, Endymion Corporation | 1997 - Present**
**CTO, Venue Driver | 2007 - 2013**
**Executive Director of Technology, Angel Management Group | 2013 - 2014**

Built and licensed a commercial Perl-based webmail product in the era when Hotmail was a new idea. Co-founded CoolJunkie.com, a Miami Beach nightlife events and media joint venture that evolved into Venue Driver, the ticketing and operations platform that became mission-critical infrastructure through the Hakkasan and Tao Group acquisitions, building its original technology function and core ticketing, reservation, and guest-management systems.

**Shipping mobile software since the 1990s**, long before the category existed: a WAP/WML application delivered under contract, then a BlackBerry interface for Venue Driver that predated the iPhone, then HTML mobile web and native iOS support as the platform matured.

## Education and Early Research

**University of Florida | BS, Computer Science**

- Engineering intern at 3Dfx Interactive, later acquired by Nvidia, during development of the original Voodoo Graphics chipset (SST-1), the product that brought hardware 3D acceleration into mainstream consumer computing. Wrote unit tests for the pixel-accurate simulator used to verify the rendering pipeline before silicon, and contributed to the internal GL library that became the basis for Glide.
- Undergraduate research assistant on US Department of Defense-funded computer-vision projects using C++ and multispectral imagery for automated mine detection and image-distortion correction.
- Undergraduate teaching assistant for a course based on *Structure and Interpretation of Computer Programs* and contributor to research on automated code analysis and refactoring.

## Technical Expertise

**Applied AI:** self-evolving agents, hill-climbing optimization, fine-tuning, training-data pipelines, synthetic data generation, data-leakage control, agent DSLs and runtimes, data flywheels, automated evaluation, champion/challenger promotion gating, confidence calibration, human-feedback alignment, root-cause analysis, topic modeling (BERTopic), Hidden Markov models, vector search, model explainability (SHAP), LangChain, LangGraph, DSPy, Model Context Protocol (MCP), MLOps, LLMOps
**Data Engineering:** data warehouses, data lakes, data pipelines and processing, data archival, information architecture, corpus analysis, analytics, operational and regulatory reporting
**Cloud and Governance:** AWS, serverless architecture, Lambda, ECS, SQS, EventBridge, Amplify, SageMaker, Kubernetes, PostgreSQL, infrastructure as code (AWS CDK, Helm), distributed workloads, containers, observability, failure recovery, information security, PCI-scope reduction, compliance reporting
**Engineering:** Python, Rust, Lua, C++, C#, Ruby, TypeScript/JavaScript, iOS and mobile web, ANTLR, scikit-learn, XGBoost, Qdrant, Docker, MLflow, TensorFlow, BERT, Athena, QuickSight
